LECTURE-02

Parametrization

The key to parametrization is to realize that the goal of this method is to describe the location of all points on a geometric object, such as a curve, a surface, or a region. This description must be one-to-one and onto: every point must be described once and only once.

$$\gamma := \{(x,y) : x^2 + y^2 = 1\}$$

If you want to geometrically analyze the curve γ (length/enclosed area, etc), we need a manageable way to produce the points (production scheme).

Motivation of Parametrization

Parametric curve: A curve in the 2-D plane can be described by,

$$\left.\begin{array}{l} x = f(t) \\ y = g(t) \end{array}\right\} \text{ where } a \leqslant t \leqslant b$$

These are called parametric equations for that curve, and t is the parameter.

What is the difference between general and parametric curves?

Example

Plot the parametric curves defined by,

$x = \cos t, y = -\sin t; 0 \leq t \leq \pi$

$x = t, y = 1; 0 \leq t \leq 4$

$z = 1 + it; 0 \leq t \leq 1$

Straight line from $(0, 3)$ to $(2, 3)$

Straight line from $(2, 3)$ to $(2, 4)$

Straight line from $(0, 3)$ to $(2, 4)$

Formula

$$\boxed{\text{Line segment: } \gamma(t) = a + t(b-a), 0 \le t \le 1}$$

$$\boxed{\text{Circle: } \gamma(t) = (a + r\cos(t), b + r\sin(t)), 0 \le t \le 2\pi}$$

$$\boxed{\text{Explicit function: } \gamma(t) \stackrel{y=f(x)}{=} (t, f(t))}$$

$$\boxed{\text{Explicit function in polar: } \gamma(t) \stackrel{r=f(\theta)}{=} (f(t)\cos(t), f(t)\sin(t))}$$

Smooth Curves

Derivative exists at all points and is continuous

Motivation of line integral

Path in complex integration

Is there any meaning of

$$\int_{z_1}^{z_2} f(z)dz = ?$$

Path in complex integration

Is there any meaning of

$$\int_{z_1}^{z_2} f(z)dz = ?$$

Consider $C : z(t) = h(t) + ig(t); a \leq t \leq b$ Then line integral (or complex line integration) of f along C is defined as,

$$\int_C f(z)dz = \int_a^b f(\gamma(t))\gamma'(t)dt$$

Example

$C_1 : z(t) := \gamma(t) = t, 0 \leq t \leq 1$
$C_2 : z(t) = 1 + it, 0 \leq t \leq 1$
$f(z) = \bar{z}$ $C_3 : z(t) = \gamma(t) = t(1+i), 0 \leq t \leq 1$
